

Layer Picker Flex-R - One Solution Multiple Applications

The Layer Picker Flex-R uses the same well proven and patented technology as the original Qubiqa Layer Picker.

The Flex-R solution makes use of a new and lighter version of the Layer Picker mounted on an articulated robot arm. The robot arm can move the layer picker in all directions, offering completely new application possibilities.

With up to 8 picking positions the Layer Picker Flex-R can be used for both picking for replenishment and batch layer picking at the same time. This means that the Flex-R solution can be used for pallet to pallet picks and negative picking as well.

One machine – multiple applications

The Layer Picker Flex-R can lift up to 250 kg, and the high cycle capacity means that it can move more than 450 tons in a shift. For the customers using the Flex-R this means higher throughput with less effort.

For more information about the new Layer Picker solutions available from Qubiqa please see www.qubiqa.com
